

Lesbian Lizards

@schoabe

Desert Grassland
Lizards are all female

They reproduce by
parthenogenesis

An illustration featuring two lizards against a plain white background. On the left, a lizard with a dark greyish-brown body and several bright yellow-green longitudinal stripes is shown in profile, facing right. Its tail is long and curved upwards. On the right, a plain orange lizard is shown in a similar profile, also facing right. The orange lizard's tail is also long and curved, extending towards the bottom of the frame. The two lizards are positioned as if they are interacting or observing each other.

Fertilisation of eggs
isn't necessary

But female-female
mating is still common

*Women might
secretly be lizards*
